Battery Types: Different batteries, like nickel-cadmium, nickel-metal-hydride, and lithium-ion, will have varying internal resistances and, consequently, different talk-times. Fact : A lithium-ion battery with low internal resistance can offer up to 20% more talk-time than a nickel-cadmium battery of the same capacity but with higher internal resistance.

By connecting a battery or other source of current to the two electrodes, we can force the reaction to proceed in its non-spontaneous, or reverse direction. By placing an ammeter in the external circuit, we can measure the amount of electric charge that passes through the electrodes, and thus the number of moles of reactants that get transformed into products in the cell reaction.
