Inside, capacitors are  $18 \times 2700\mu\text{F} = 0.050 \text{ F}$  (or amps-seconds/volt) That capacitor could carry 2300A for 1 millisecond, 23,000A for 0.1 millisecond charging to 48V. Energy  $\frac{1}{2} C V^2 = 56 \text{ joules}$  (at 48V); this is what's available to damage a contact. I attempted

Outdoor installation of solar inverters is more common than indoor installation primarily because it saves space, improves energy transfer efficiency, and lowers installation costs. However, when choosing the optimal location, considerations should include protection, ease of maintenance, and local climate conditions.

So, in order to size the resistor vs how long the pre-charge will take, I need to know the capacitance of the inverter. I don't have my inverter yet, but I'd like to get a resistor ordered for the initial bench-test hookup. Watching @Will Prowse 's precharge video, he links to a 30Ohm 25W resistor, and he says to use it for a few seconds.

However, if you have a relatively high internal resistance in the battery AND the load is pulsed rather than continuous, adding a modest amount of capacitance can reduce  $I^2 R$  losses and reduce voltage sag to the inverter during the current pulse.

Noise Levels A quiet AC is a happy AC. Check the noise levels in the product specifications and aim for a unit with a noise level below 50 decibels. That way, you can enjoy your favorite TV show without being interrupted by a noisy AC. ...
