Electrical energy is the movement of electrons. Applying a force can make some of the electrons move, and electrons moving is called electricity.

As the world continues to enact progressive climate change targets, renewable energy solutions are needed to achieve these goals. One such solution is large-scale lithium-ion battery (LIB) energy storage systems which are at the forefront in ensuring that solar- and wind-generated power is delivered when the grids need it most.

What is a cell in a battery. The anode is the negative electrode and it loses electrons during the oxidation process to the external circuit. Our commonly used batteries are 3.2v and 3.7v lithium ion battery cells.. The cathode is the positive electrode and it accepts electrons from the external circuit through reduction.
