Lead-acid batteries are very heavy. Weight can be a severe drawback for mobile applications.

This is not correct. The coils of the contactors are the only parts connected to the low-voltage battery - these only consume a few watts. Much higher current (hundreds of amps during acceleration, regenerative braking, and DC fast charging) flows through the contacts of the contactors. The highest loads on the low-voltage system are the electric power steering ...

Fast Charging: Unlike lead acid batteries that take hours to fully charge, lithium-ion batteries can reach 80% capacity in just one hour, making them ideal for applications like electric vehicles where quick charging is essential.

Another benefit of lithium batteries is how long their life span is. They cycle 5,000+ times vs up to 1,000
