First, let's define what these batteries are. A 12V battery is a lead-acid battery that is commonly used to power vehicles and boats. It has a nominal voltage of 12 volts and is rechargeable. On the other hand, a 12V AGM battery is also a lead-acid battery, but it uses Absorbed Glass Mat (AGM) technology to hold the electrolyte in place.

At the positive battery terminal, the electrons rush back in and are accepted by the positive plates. The oxygen in the active material (lead dioxide) reacts with the hydrogen ions to form water, and the lead reacts with the sulfuric acid to form lead sulfate.

Batteries of this type fall into two main categories: lead-acid starter batteries and deep-cycle lead-acid batteries. Lead-acid starting batteries These batteries are designed to provide a significant burst of power for a short period of time to start the engine and are subsequently recharged by the vehicle's alternator while it is running.

Overview of Lead-Acid and Lithium Battery Technologies Lead-Acid Batteries. Lead-acid batteries have been a staple in energy storage since the mid-19th century. These batteries utilize a chemical reaction between lead plates and sulfuric acid to store and release energy. There are two primary categories of lead-acid batteries:
