Solar panels, also known as photovoltaic (PV) cells, are devices that convert sunlight directly into electricity. Each panel is made up of many small cells that capture sunlight and, through a process called the photovoltaic effect, generate electrical current. Typically, these cells are made from silicon, a semiconductor material. When ...

When we connect N-number of solar cells in series then we get two terminals and the voltage across these two terminals is the sum of the voltages of the cells connected in series. For example, if the of a single cell is 0.3 V and 10 such cells are connected in series than the total voltage across the string will be $0.3 \text{ V} \times 10 = 3 \text{ Volts}$.
