Thick and dense graphite anodes used in lithium-ion batteries (LIBs) suffer from sluggish reaction kinetics at the electrode level, causing Li metal plating on their surfaces and significant capacity decay at high charging currents. Thus, it is crucial to tailor electrodes based on a comprehensive understanding of the complex reaction kinetics to realize ...

Lithium-ion batteries can have multiple intercalating materials in both the positive and negative electrodes. For example, the negative electrode can have a mix of different forms of carbon. Similarly, the positive electrode can have a ...

This study has elucidated a microstructural design and optimization strategy to improve the discharge rate performance of lithium-ion battery electrodes across multiple length scales, ranging from the arrangement of primary particles, the ...

Towards unified machine learning characterization of lithium-ion battery degradation across multiple levels: A critical review ... Advances in the design and fabrication of high-performance flow battery electrodes for renewable energy storage ... A perspective on inverse design of battery interphases using multi-scale modelling, experiments and ...

The modelling of mechanical effects in lithium-ion batteries needs consideration across multiple length scales, from particle level interactions at the micro-scale up to cell level effects at the macro-scale [8], [9], [10]. Early mechanical models for lithium-ion batteries include the work of Christensen and Newman [11], [12] and Zhang et al. [13] in the ...

The advances and refinements in electrode materials have yielded impressive results. Moreover, in the case of
thick lithium-ion battery electrodes with rapidly increasing thickness, the performance of both the electrodes
and the batteries heavily depends on the microstructural parameters [38]. Consequently, enhancing the cycling
stability and ...

The lithium-ion battery (LIB) electrode represents a complex porous composite, consisting of multiple phases
including active material (AM), conductive additive, and polymeric binder. This study proposes a mesoscale
model to probe the effects of the cathode composition, e.g., the ratio of active material, conductive additive,
and binder content, on the ...

A multiscale platform has been developed to model lithium ion battery (LIB) electrodes based on the real
microstructure morphology. This multiscale framework consists of a microscale level where the electrode
microstructure architecture is modeled and a macroscale level where discharge/charge is simulated. ... A

Conventional lithium ion batteries employ crystalline materials which have stable electrochemical potentials to allow lithium ion intercalation within the interstitial layers or spaces. 6 The ...

We adapt a previously developed lithium-ion mathematical model to treat multiple types of active materials in a single electrode; our model treats both direct (galvanostatic) and alternating (impedance) currents. We compare our simulations to experimental data from coin cells built with two positive-electrode materials (compositions ...

Here, we correlate the discharge rate performance of Ni-rich $\text{LiNi}_{1-x-y}\text{Co}_x\text{Mn}_y\text{O}_2$ (NMC) cathodes to the electrode architectures, ranging from the crystallographic orientations, surface ...

With the extensive application of lithium batteries and the continuous improvements in battery management systems and other related technologies, the requirements for fast and accurate modeling of lithium batteries are gradually increasing. Temperature plays a vital role in the dynamics and transmission of electrochemical systems. The thermal effect must ...

The improvement of fast-charging capabilities for lithium-ion batteries significantly influences the widespread application of electric vehicles. Fast-charging performance depends not only on materials but also on the battery's inherent structure and the heterogeneity of the electrode reaction. Herein, we utilized advanced imaging techniques to explore how the ...

In a lithium-ion battery, lithium-ions Li^+ transfer from the anode and diffuse through the electrolyte towards the cathode during charge and when the battery is discharged, the respective electrodes change their roles. We

Lithium-ion batteries are receiving attention as a possible replacement for nickel-metal-hydride batteries in hybrid-electric vehicles (HEVs) and are the battery chemistry of choice for plug-in hybrid-electric vehicles (PHEVs).

To avoid safety issues of lithium metal, Armand suggested to construct Li-ion batteries using two different intercalation hosts 2,3. The first Li-ion intercalation based graphite electrode was ...

The Li-ion battery is fundamentally a composite material system with multiple layers of electrodes. The mechanical properties of the system evolve during the delithiation and lithiation, such as modulus and density changing at different SoCs. A nondestructive evaluation technique using ultrasound was recently applied for battery SoC estimation.

The demand for high capacity and high energy density lithium-ion batteries (LIBs) has drastically increased nowadays. One way of meeting that rising demand is to design LIBs with thicker electrodes. Increasing electrode thickness can enhance the energy density of LIBs at the cell level by reducing the ratio of inactive materials in the cell. However, after a ...
