Although we don't expect sodium-ion batteries to overtake lithium-ion ones in the short to medium term, sodium-based batteries have the potential to complement lithium-based ones, reduce dependence on a single material, and alleviate some of the pressure on lithium and battery material supply chains. This should all accelerate the green energy ...

However, sodium is three times heavier than lithium, which means sodium-ion batteries are also heavier. Sodium batteries may also be less powerful because they have a lower cell voltage.

In fact, the world's leading battery maker CATL is integrating sodium ion into its lithium ion infrastructure and products. Its first sodium ion battery, released in 2021, had an energy density of 160 Wh/kg, with a promised 200 Wh/kg in the future. In 2023, CATL said Chinese automaker Chery would be the first to use its sodium ion batteries.

Lithium battery replacement for sodium

While it's certainly possible Jack was working on sodium in parallel, I find it odd that he would ask me to design a BMS for his existing lithium module design if he was already working on a replacement sodium product in 2023. In other words, I suspect "V3 is sodium" was at most a twinkle in Jack's eye circa 2023.

Why can't sodium-ion batteries replace lithium-ion batteries? Sodium-ion batteries generally have lower energy density compared to lithium-ion batteries. This means they store less energy per unit of weight or volume, which impacts their suitability for applications requiring high energy density, like smartphones and electric vehicles. While sodium-ion ...
