Lithium-ion (Li^+) batteries are widely used in portable electronics and vehicles. However, fast charging and discharging at room temperature and charging at subzero temperature are still great challenges. Graphite is presently the most common anode material for lithium-ion batteries, but the long diffusion distance of Li^+ limits its rate performance.

The typical electrolytes in Li-ion/metal batteries consist of solute (lithium salts) and solvents (mainly organic solvents). In the electrolyte formulation process, lithium salts are dissolved in solvents to form a homogeneous solution, which is subsequently processed and added to the battery as an electrolyte [22]. Generally, the main ...

Lithium-sulfur (Li-S) batteries are a superior candidate as a next-generation battery system due to the outstanding energy density (2600 Wh kg^{-1}) [[1], [2], [3], [4]]. Extending the operation temperature is of great importance to tap the potential of Li-S batteries in broader scenarios [[5], [6], [7]]. However, imminent issues related to sluggish reduction ...

A 2021 study found that lithium concentration and production from brine can create about 11 tons of carbon dioxide per ton of lithium, while mining lithium from spodumene ore releases about 37 tons of CO_2 per ton of lithium produced. 5 . The social impacts of lithium mining depend on how mining companies behave and how ...

Driven by the increase in portable devices, electric vehicles, and grid storage markets, the demand for lithium-ion batteries (LiBs), and consequently lithium, has accelerated significantly over recent years [1, 2] is estimated that 80% of the global end-use for lithium goes toward battery technologies []--an increase from 39% in 2017 [] ...

Lithium-ion batteries are widely used in EVs due to their advantages of low self-discharge rate, high energy density, and environmental friendliness, etc. [12], [13], [14] spite these advantages, temperature is one of the factors that limit the performance of batteries [15], [16], [17] is well-known that the preferred working temperature of EV ...

Specifically, the prospects of using lithium-metal, lithium-sulfur, and dual-ion batteries for performance-critical low-temperature applications are evaluated. These three chemistries are presented as prototypical examples of how the conventional low-temperature charge-transfer resistances can be overcome.

Here we report a lithium-ion battery structure, the "all-climate battery" cell, that heats itself up from below zero degrees Celsius without requiring external heating devices or electrolyte additives. ... Previous attempts to improve the low-temperature performance of lithium-ion batteries have focused on developing additives to improve the ...

Currently, most lithium is extracted from hard rock mines or underground brine reservoirs, and much of the energy used to extract and process it comes from CO₂-emitting fossil fuels. Particularly in hard rock mining, for every tonne of mined lithium, 15 tonnes of CO₂ are emitted into the air. Battery materials come with other costs, too.

Stable operation of rechargeable lithium-based batteries at low temperatures is important for cold-climate applications, but is ...

The lithium-ion battery (LIB) has the advantages of high energy density, low self-discharge rate, long cycle life, fast charging rate and low maintenance costs. It is one of the most widely used chemical energy storage devices at present. However, the safety of LIB is the main factor that restricts its commercial scalable application, ...

This is because the rate of diffusion of lithium-ions inside the battery at low temperature, especially the diffusion coefficient of the solid phase decreases rapidly, and lithium-ions cannot quickly move from the negative electrode into the positive electrode material [39, 40]. This will lead to a large drop in the terminal voltage of the LIB ...

Although TiNb₂O₇ (TNO) with comparable operating potential and ideal theoretical capacity is considered to be the most ideal replacement for negative Li₄Ti₅O₁₂ (LTO), the low ionic and electronic conductivity still limit its practical application as satisfactory anode for lithium-ion batteries (LIBs) with high-power density. Herein, TNO ...
