o the mains inductances are high, o the line transformer ratings are low, o the transformer short-circuit voltage is high, o the ratio between the sum of the ratings of the capacitors already switched into the circuit and that of the capacitors to be switched in is small (for multiple-step capacitor banks). In practice, the current peak is often incompatible with the characteristics of ...

The two main standards IEC 62271-100 and IEEE C37.09 provide the required number of operations and test parameters. IEEE C37.66 defines separate procedures for load break switches and capacitor switches. The true purpose of these tests is to ensure that the switching device will meet the needs of the application. Fielded switches are subjected to a wide array of ...

due to capacitor banks switching was becomes a big concern on these matters. Energizing of a capacitor bank that nearby fixed capacitor bank already in service produced a phenomenon called bank-to-bank switching [2]. Installing capacitors to correct the power factor at particular locations is one way to enhance power system reliability. This paper offers a new formulation to address the issue of optimal placing capacitors. The proposed formulation considers reliability impact, in addition to the transient switching events. This is reflected in the cost minimization objective function, where ...

These capacitors are known as "Y capacitors" (X capacitors on the other hand are used between mains live and mains neutral). There are two main subtypes of "Y capacitor", "Y1" and "Y2" (with Y1 being the higher rated type). In general Y1 capacitors are used in class 2 equipment while Y2 capacitors are used in class 1 equipment.
