The basis of all solar thermal systems is the transfer of heat - from the sun's radiation to a solar fluid, from the fluid to a heat exchanger and from the exchanger to the domestic supply. There's no need to understand the physics of actual heat transfer, but it is important to understand where heat goes and what happens when it does.

Solar thermal power plants are electricity generation plants that utilize energy from the Sun to heat a fluid to a high temperature. This fluid then transfers its heat to water, which then becomes superheated steam. This steam is then used to ...
