# New information about lithium batteries

The new electrolyte is similar to a known material containing lithium, yttrium and chlorine, but swaps some lithium for sodium -- an advantage as lithium is costly and in high demand (SN: 5/7/19).

Prof. Donald Sadoway and his colleagues have developed a battery that can charge to full capacity in less than one minute, store energy at similar densities to lithium-ion batteries and isn't prone to catching on fire, reports Alex Wilkins for New Scientist.. There are two types of lithium batteries that U.S. consumers use and need to manage at the end of their useful life: single-use, non-rechargeable lithium metal batteries and re-chargeable lithium-polymer cells (Li-ion, Li-ion cells). Li-ion batteries are made of materials such as cobalt, graphite, and lithium, which are considered critical ...

Pioneering work of the lithium battery began in 1912 under G.N. Lewis, but it was not until the early 1970s that the first non-rechargeable lithium batteries became commercially available. Attempts to develop rechargeable lithium batteries followed in the 1980s but failed because of instabilities in the metallic lithium used as anode material.

A modern lithium-ion battery consists of two electrodes, typically lithium cobalt oxide (LiCoO<sub>2</sub>) cathode and graphite (C<sub>6</sub>) anode, separated by a porous separator immersed in a non-aqueous liquid ...

Previous lithium-air battery projects, typically using liquid electrolytes, made lithium superoxide (LiO<sub>2</sub>) or lithium peroxide (Li<sub>2</sub>O<sub>2</sub>) at the cathode, which store one or two electrons per ...
