From left to right - pairs of capacitors connected in parallel and then each pair is connected in series to each other and to the rest capacitor. Equation for parallel connection is C+C, so you have 2C, 2C and C connected in series. For series you have 1/Ctotal = 1/(2C) + 1/(2C) + 1/C. Hence Ctotal = 1/(2/C) equals to 0.5uF.

Capacitors in series share the same charge because the charge comes from the neighbouring plate. The total charge is equal to q1 and q2, and therefore the charge is equal. Knowing this, the charge terms cancel out by dividing the previous expression throughout by q...

Capacitor in Series. In a series connection, capacitors are connected end-to-end, forming a single path for the flow of current. To calculate the total capacitance in a series circuit, you need to use the reciprocal formula. Simply put, you take the reciprocal of each capacitor's value and add them together. The equivalent capacitance (C) can be calculated ...

When you place multiple capacitors in series, you are effectively increasing its plate separation. As d goes up, C goes down.
