With the latent heat, the phase change material (PCM) is widely used in battery thermal management (BTM) to control the temperature. In this paper, the porous medium is employed to enhance the heat transfer of PCM.

Sodium-ion batteries (SIBs) have emerged as a promising alternative to lithium-ion batteries (LIBs) in sectors requiring extensive energy storage. The abundant availability of sodium at a low cost addresses concerns associated with lithium, such as environmental contamination and limited availability. However, SIBs exhibit lower energy density and cyclic ...

1 INTRODUCTION. Covalent organic frameworks (COFs) are a new kind of crystalline porous materials constructed completely by organic building blocks, which exhibit excellent porosity, ordered channels, and strong robustness in most solvents. 1-3 Since the first COF was reported by Yaghi et al. in 2005, hundreds of two-dimensional (2D) and three ...

In this study, the effects of the porous material in cold plate minichannels for a prismatic battery thermal management system have been investigated by numerical simulation. In general, increasing the inlet velocity in a fully porous minichannel improves the cooling performance more than in a conventional (non-porous) channel.

This interdisciplinary, bimonthly journal focus on research synthesis, processing, characterization and evaluation of all porous materials. The detailed scope text can be found here.; Fundamental properties: liquid-solid, solid-solid phase transitions in pores, effects of confinement on gases, liquids and organic molecules, adsorption, ion exchange and sieving, molecular sieving, and ...

Among the metal-organic frameworks (MOFs), MIL-53(Fe) or $\text{FeIII}(\text{OH})0.8\text{F}0.2[\text{O}_2\text{C}-\text{C}_6\text{H}_4-\text{CO}_2]$ was the first ever reported member to reversibly insert Li^+ electrochemically. A variety of electroactive sorbents has been investigated in an attempt to increase its electrochemical capacity vs Li^+/Li^0 . Here, we describe the synthesis and ...

Therefore, this research focuses on the use of discarded grains from baijiu as a raw material for the production of porous hard carbon materials, specifically for the anode of sodium-ion batteries. The proposed synthesis procedure involves the use of a ZnCl_2 chemical treatment to generate hard carbon materials that possess a porous structure ...

With the rapid development of silicon-based lithium-ion battery anode, the commercialization process highlights the importance of low-cost and short-flow production processes. The porous carbon/silicon composites (C/Si) are prepared by one-step calcination using zinc citrate and nano-silicon as the primary raw materials at a temperature of $950 \pm 176^\circ\text{C}$.

Introduction. Lithium-ion batteries (LIB) are widely employed in the sectors of consumer electronics, transportation and industrial applications. 1 In comparison to other common battery types, like lead-acid or nickel metal-hydride, commercial LIBs reach a high specific energy 1, 2 ranging up to 300 Wh kg⁻¹. 3 However, continued improvements in specific energy are ...

Nitrogen-doped porous carbon (NPC@ZIF-11) and boron-NPC (BNPC@ZIF-11) materials were synthesized by pyrolysis methods, and structural characterization of the compounds was carried out by scanning electron microscopy, transmission electron microscopy, Fourier-transform infrared spectroscopy, X-ray diffraction, Brunauer-Elmet-Teller technique, ...

The perspectives of porous materials for Li-O₂ batteries are outlined, the advances of porous materials for targeting critical battery challenges are highlighted, rational design and future ...

Porous carbon anode materials is synthesized by using rice hull natural SiO₂ as templates, and the materials with a specific surface area of 332 m² g⁻¹ has possessed micropores, mesopores and macropores microstructure. The materials display a high capacity of 756.9 mAhg⁻¹ after 150 charge-discharge cycles at 0.2C and 620 mAh/g after 600 cycles at ...

An amorphous carbon material was prepared through pyrolysis and hydrothermal activation method using sisal fiber as precursor [10]. Similarly, porous carbon with high surface area and porous structure derived from jute fiber exhibits a specific charge capacity of 580.4 mA h g⁻¹ at the current density of 0.2 C after 100 cycles [11].

Benefiting from their tunable structural parameters, hollow porous carbon materials (HPCM) remarkably enhance the performances of both sulfur cathodes and lithium anodes, promoting the development of high-performance Li-S batteries. Here, together with the templated synthesis of HPCM, recent progresses of Li-S batteries based on HPCM are ...

Porosity is frequently specified as only a value to describe the microstructure of a battery electrode. However, porosity is a key parameter for the battery electrode performance and mechanical properties such as adhesion and structural ...

Battery modeling has become increasingly important with the intensive development of Li-ion batteries (LIBs). The porous electrode model, relating battery ...

The use of porous materials as electrodes in Li-ion batteries with liquid electrolytes has been studied extensively [13,14,15]. In such systems, pore walls enlarge the ...

Porous electrodes are an integral part of many electrochemical devices since they have high porosity to maximize electrochemical transport and high surface area to maximize activity. Traditional porous electrode materials are typically homogeneous, stochastic collections of small-scale particles and offer few opportunities to engineer higher performance. ...

Due to the growing demand for eco-friendly products, lithium-ion batteries (LIBs) have gained widespread attention as an energy storage solution. With the global demand for clean and sustainable energy, the social, economic, and environmental significance of LIBs is becoming more widely recognized. LIBs are composed of cathode and anode electrodes, ...

Porous silicon particles were synthesized with the magnesium thermal reduction method, combined with hydrofluoric acid etching. The porous silicon can be applied to be the anode material of lithium-ion batteries. The synergistic effect of magnesium thermal reduction and acid etching on the preparation of porous silicon materials was studied.

Active electrode materials in lithium-ion batteries are porous. These materials are composed of a solid frame containing interconnected pores/channels, in which mass transport follows a tortuous ...

A rigid hierarchical porous ceramic MF membrane coated with small amounts of a polyelectrolyte was used in a zinc-iron flow battery. The rigid porous structure of the ceramic membrane not only provided fast ion transport ...

The Li-S secondary battery using elemental sulfur as the positive electrode and lithium metal as the negative electrode exhibits a higher theoretical specific capacity (1675 mAh/g) and a theoretical specific energy (2600 Wh/kg), far exceeding the conventional lithium-ion (Li-ion) battery [23], [24], [25], [26]. At the same time, elemental sulfur also has the advantages of ...
