Working Principle of a Lead-Acid Battery. Lead-acid batteries are rechargeable batteries that are commonly used in vehicles, uninterruptible power supplies, and other applications that require a reliable source of power. The working principle of a lead-acid battery is based on the chemical reaction between lead and sulfuric acid.

The battery has thin plates or electrodes with larger surface area for high current capability. This type of lead-acid battery is designed to have high power density, but it has low total energy content and is not designed for applications that require energy delivered for long periods of time. It can also not handle deep discharge.
