The present and future energy requirements of mankind can be fulfilled with sustained research and development efforts by global scientists. The purpose of this review paper is to provide an overview of the fundamentals, recent advancements on Lithium and non-Lithium electrochemical rechargeable battery systems, and their future prospects.

The design of the battery temperature equity is important. The uniformity of the temperature of the lithium battery pack is critical to the performance and life of the lithium battery system. The uneven distribution of temperature can easily lead to a heat escape from the lithium battery pack, which could pose safety hazards for the electric car.

A battery pack is an energy storage device that includes battery modules, battery electronics, high-voltage circuitry, overcurrent protection devices, battery boxes, and interfaces with other external systems (e.g., cooling, high-voltage, auxiliary low voltage, and communications). Opening a battery pack is not an easy task.
