HV Power Capacitors are designed to compensate inductive loading from devices like electric motors and transmission lines to make the load appear to be mostly resistive.

These units reduce the required apparent power and avoid over-sizing of equipment and thus lead to significant cost savings. This power factor compensation equipment is also used to filter harmonics generated from various sources - most often from variable speed drives.

Reactive power compensation is important for power system reliability and voltage control. Inductive loads require reactive power to maintain flux, while capacitive loads store reactive power. Shunt capacitors are used to ...
