Lead acid batteries were the first form of rechargeable battery which are still used today. As we learned in history of batteries; lead acid batteries were developed in 1859 by Gaston Plante. This battery type is still used today in many industries, especially popular as car batteries, but also commonly used in photovoltaic systems.

Using lead acid chargers may damage or reduce the capacity of lithium batteries over time. Charging lithium batteries at a rate of no slower than  $C/4$  but no faster than  $C/2$  is recommended to maximize battery life. The charge cutoff current is typically determined by the charger, and the voltage range should stay within the limits to prevent damage.

The recommended storage temperature for most batteries is  $15^{\circ}\text{C}$  ( $59^{\circ}\text{F}$ ), with the extreme allowable temperature being  $-40^{\circ}\text{C}$  to  $50^{\circ}\text{C}$  ( $-40^{\circ}\text{C}$  to  $122^{\circ}\text{F}$ ) for most chemistries.
