2.2. Analysis of the effect of parallel virtual capacitor. It can be seen from Eq. Therefore, the voltage drop ( $\Delta u$ ) is mainly determined by the reactive power flow along the line. That is, the magnitude difference between  $\theta_1$  and  $\theta_2$  depends mainly on the reactive power transits. Instead, the active power substantially affects the phase difference between  $\theta_1$  and  $\theta_2$ . According to this, the flow of reactive power has ...
