A car battery isn't capable of generating enough voltage to shock you (but the ignition coil can.) It is however capable of generating enormous current and can easily melt things and start fires. You need to be careful with anywhere that is not fused. That means the battery itself and the starter motor. You should also be careful with electronics.

It's widely assumed that the battery supplies all of the power required by a car's electrical system. That's not the case. The battery channels electrical current to the starter motor, which helps the engine to start. Once the engine gets rolling, the alternator collaborates with the battery to supply current to the car's electrical system.
