The solenoid valve can be configured as either normally open or normally closed; normal state refers to the state when the solenoid valve is de-energized. When de-energized, a normally open valve opens, and when energized, it closes. In the case of normally closed valves, the opposite is true. Three-way Solenoid Valves. A 3-way valve has three connection ports. Typically, it has ...

An air vent valve is provided at the solar collectors to avoid the piping becoming air bound, purging un-wanted air in the water circulation loop. A tempering valve or mixing valve is installed to mix cold water in with the outgoing hot water from the hot water tank, permitting storage of more heat in the water tank without risking scalding building occupants. We discuss tempering ...

Some systems include a solenoid valve that will open to drain some water from the tank if overheated. Draining the Collector and Piping. Solar water heating systems that use only water as a heat-transfer fluid are the most vulnerable to freeze damage. "Draindown" or "drainback" systems typically use a controller to drain the collector loop ...
