At present, the energy density of the mainstream lithium iron phosphate battery and ternary lithium battery is between 200 and 300 Wh kg⁻¹ or even <200 Wh kg⁻¹, which can hardly meet the continuous requirements of electronic products and large mobile electrical equipment for small size, light weight and large capacity of the battery.

Silicon Fuel is a suitable material for H₂ storage and its specific energy is maximised by transporting it as a dry formulation and using it with a local source of water to generate H₂ on demand. Silicon Fuel could be considered as a "green" source of H₂ if the energy required for the ball milling process is supplied by a renewable source of electricity.

In these newly developed energy storage devices, high energy density LIBs had become the most mature and widely used energy storage [11], [12], [13]. As a substitute for fossil fuel, LIBs had been extended to portable energy storage devices (mobile phones, pad, portable battery, etc.), electric vehicles (EVs), electric motorcycles (EMs) and large-scale storage of ...
