I recently bought a solar lamp circuit from AliExpress. The board requires three peripheral components - a li-ion battery, a solar cell, and an LED. The board has a constant current output to the LED of 300mA (output voltage of 2V - 3.3V). I'd like to use it to drive about 60mA to an LED, and so I need to reduce the board's 300mA output.

If a solar panel that is characterized for 12V is applied with a 6V battery, the maximum current must be reduced to about 0.7A: e.g. battery voltage = 6V, solar panel voltage = 18V. $P = (18V - 6V) * 0.7A = 9.6W$. In this case, the solar panel power may not exceed 10W. When charging, the heat sink normally runs warm.
