The voltage would typically be around 300V DC, and the rectifier and capacitors have to be rated for that voltage plus a safety factor. I assume that you are needing a low voltage DC, since you have 25Vdc capacitors...

A capacitor is an electrical component that stores energy in an electric field. It is a passive device that consists of two conductors separated by an insulating material known as a dielectric. When a voltage is applied across the conductors, an electric field develops across the dielectric, causing positive and negative charges to accumulate ...

In a dc pulsed power supply (PPS), its instantaneous output power is pulsed, and its input power is required to be constant. In order to balance the instantaneous power difference, a storage capacitor is usually connected to the output terminal of the PPS. However, the storage capacitor is extremely large when the pulse repetition ...

An electrolytic capacitor is a type of polarized capacitor that uses a wet electrolytic solution and an oxide film to store electrical charge. An example is the aluminum electrolytic capacitor which contains two closely spaced spooled strips of aluminum foil for the positive anode and negative cathode.

The size of the capacitor is determined by the size of the potential output current transient and the allowable input voltage ripple of the design specification. The necessary capacitance needed can often be quite large and therefore Electrolytic Capacitors are often used for bulk capacitance.

Power factor correction capacitors are highly sensitive to harmonics since the capacitive im-pedance is inversely proportional to frequency. This means that, when supplied by a ...

A leaky capacitor has the effect of a large rated capacitor that leaks and keeps the circuit from working properly. In most cases, you can over rate a capacitor and get away with it. If you double the voltage value of the capacitor but keep the supply voltage low you might want to also double the Farad value.
