In electrical engineering, a capacitor is a device that stores electrical energy by accumulating electric charges on two closely spaced surfaces that are insulated from each other. The capacitor was originally known as the condenser, [1] a term still encountered in a few compound names, such as the condenser microphone is a passive electronic component with two terminals.

I was planning on getting a Soundstream Power Plant Distribution block and 2.0 Farad capacitor. Distribution block comes from the battery, and then all the power cables go out from there to all the components, correct? And then the capacitor comes right after the Distribution block, correct? And what are the advantages/disadvantages of both?
