The two main types of electric locking devices are - No. 1: Fail Safe : When de-energized, a fail-safe locking device becomes unlocked. Because this type of lock requires power to stay locked, it's not typically used in high-security situations, simply because breaking the power supply disables the lock.

A battery is a device that stores chemical energy and converts it into electricity. Learn about the three main components of a battery, the chemical reactions that occur during discharge and charge, and the types of batteries developed by MIT researchers.

While the battery is discharging and providing an electric current, the anode releases lithium ions to the cathode, generating a flow of electrons from one side to the other. When plugging in the device, the opposite happens: Lithium ions are released by the cathode and received by the anode.

At the heart of a rechargeable battery are two key components: the cathode and the anode. These electrodes are separated by an electrolyte, which allows ions to flow between them. When the battery is being charged, ...
