A submersible pump, as its name implies, is submerged below the surface of the liquid, where it uses a propellerlike device called an impeller to move the fuel upward. Slanted blades on the rotating impeller push the water the way the blades on an electric fan push air. A suction pump moves the gas using the principle of unequal pressure. A pipe is inserted in the water.

Things that can pump up and store gas

Gasoline is a volatile liquid that emits vapors, and if these vapors can't escape the can, the consequences can be disastrous. It is rare for gas cans to explode because of this phenomenon, but there is a good chance the higher internal pressure will cause the fuel to spill out onto your body once you open the cap.

Gas cans can leak vapor even while empty. Only Fill Gas Cans to 95 Percent. Fuel expands as temperatures increase. Leaving an air gap will help avoid spillage. Place Gas Cans on the Ground Before ...
