An autonomous supply of electricity by means of rechargeable batteries would be ideal. The ESP8266 solar panel power supply is of course an obvious solution. During the day, the microcontroller is supplied with electricity from the solar cell and a battery is charged at the same time. This energy storage device is then used at night.

Choosing the Right Power Supply for Your Charger. When selecting a charger, you may need to consider the power supply. Some chargers have a built-in power supply, allowing you to plug them directly into an AC wall socket. However, many LiPo chargers require an external power supply (PSU), which you may need to purchase separately.

A battery is a very quick negative voltage source. In a 9V battery, there are two terminals: anode for positive voltage and cathode for negative voltage. As most devices are designed for positive voltage supply, the negative terminal serves as a ground. Here when the negative terminal is used as ground, electrons are not returning.

I found several statements which state, that the battery won't be used as long as it's voltage is lower than the voltage of the main power supply. 3) I heard in some tutorial about power sources, that it's in general not wise to share a common ground between grounded (my 5V wall plug power supply) and floating power sources.
