1) How inefficient is it to boost 12V to 120V and then back to 12V as in using a traditional car power inverter to power a laptop (i.e. the 12V car battery power is boosted to 120V by a power inverter and then back to 12V by the laptop's power supply)? It depends on your hardware, but it's not too terrible. You have two primary conversions: ...

power inverters A power inverter is a device which converts battery output (DC, or direct current) into 230V AC mains electricity (alternating current). 230V AC is the type of electricity supplied by utility companies to run standard domestic appliances such as a TV, fridge, radio, lights or to charge a laptop / mobile phone etc.

The third phase will be getting a 1000 watt 24v DC power supply (large) and a step-down transformer to get us at 20 volts (assuming Milwaukee didn't give much headroom on the electronics for a 24 v circuit). While yeah, the power supply will be large, i expect only the larger stationary tools to need that, so the size won't be an issue.
