For example, a battery system could be designed to allow the battery to be partitioned into low-voltage segments before work is conducted on it. Other system design mitigation methods might include widely separating the positive and negative conductors and installing insulated covers on battery intercell connector busbars or terminals.

Solar power inverters convert DC power from the battery into AC power to be consumed by several pieces of equipment in the home. Five steps are involved in the selecting and sizing of the solar energy system: calculating the electrical load of the whole home and selecting the solar panels, battery size, inverter, and charger controller.
