charging mode to pilot projects. The charging pile energy storage system can be divided into four parts: the distribution network device, the charging system, the battery charging station and the real-time monitoring system [3]. On the charging side, by applying the corresponding software system, it is possible to monitor the power storage

The advantage of float charging is that it's much safer for your batteries since there's no risk of overcharging them. Boost charging is faster and can be useful if you need to get your batteries back up to full power quickly, but it does come with some risks since it's possible to overcharge the batteries if you're not careful.

Float charging, sometimes referred to as "trickle" charging occurs after Absorption Charging when the battery has about 98% state of charge. Then, the charging current is reduced further so the battery voltage drops down to the Float voltage. The Float charge of a battery keeps the battery at maximum capacity throughout the day.
