

What energy storage can be replaced with new batteries

A new material structure could revolutionize energy storage by enabling the capacitors in electric vehicles or devices to store energy for much longer, scientists say.

Prof. Donald Sadoway and his colleagues have developed a battery that can charge to full capacity in less than one minute, store energy at similar densities to lithium-ion batteries and isn't prone to catching on fire, reports Alex Wilkins for New Scientist.. "Although the battery operates at the comparatively high temperature of 110°C (230°F)," writes Wilkins, "it is ...

As a result, the capacity of the battery -- how much energy it can store -- and its power -- the rate at which it can be charged and discharged -- can be adjusted separately. "If I want to have more capacity, I can just make the tanks bigger," explains Kara Rodby PhD '22, a former member of Brushett's lab and now a technical analyst at Volta Energy Technologies.
