Compared with the nickel-cadmium battery, its biggest advantage is environmental friendliness, and there is no heavy metal pollution. The nickel-hydrogen battery is a positive electrode plate with nickel hydroxide as the main material. The negative electrode plate with hydrogen storage alloy as the main material has a protective ability.

Later on, by thermal decomposition of electrodes, it was experimentally proved that a large amount of hydrogen accumulates in the sintered electrodes of the nickel-cadmium batteries during their operation in the form of the metal hydrides [29], [30], [31].For example, in electrodes of the battery KSX-25 (with the capacity 25 Ah and sintered electrodes) after five ...

Composition and Functionality of NiMH Battery: Electrodes and Electrolyte. Nickel metal hydroxide (NiOOH) is used as the positive electrode in NiMH batteries, while an alloy that absorbs hydrogen is used as the negative electrode. This alloy is commonly composed of nickel and rare earth metals.

The negative electrodes are spongy lead metal and the positive electrodes are lead impregnated with lead oxide. As the battery is discharged, metallic lead is oxidized to lead sulfate at the negative electrodes and lead oxide is reduced to lead sulfate at the positive electrodes. ... is a secondary cell very similar to the nickel-cadmium cell ...

It consists of a nickel-plated cathode, cadmium-plated anode, and a potassium hydroxide electrode. The positive and negative plates, which are prevented from shorting by the separator, are rolled together and put into the case.

However, cadmium is not usually applied as a metal to form a battery anode. The cadmium electrode may be formed starting with a mixed cadmium hydroxide, and/or cadmium oxide and a certain amount of cadmium powder. Two types of cadmium electrode are also widely used. One is the pasted cadmium electrode.
