I remember tearing capacitors apart as a child in the 70's (and trying to launch old dead valves as "rockets") and the caps all used aluminium foil rolls and some kind of grease. Only the variable caps used solid metal plates. I never tore a cap apart later on, but certainly have had my fair share of exploding electrolytics!

In many cases - mostly high-end electrolytic capacitors - the proprietary dielectric material inside an audio-grade capacitor is meticulously manufactured to create robust, high-capacitance capacitors. An audio-grade capacitor's goal is to minimize the amount of distortion and feedback between the audio and power signal.

I need capacitors rated for 50 kV. Buying them is an option but the ones with appropriate voltage rating I have seen cost more than 50EUR which is far too much. That's why I want to make caps on my own but the simple aluminium foil - plastic foil - aluminium foil trick won't do it. Such caps can barely resist voltages higher than 5 kV.
