Hi all, While learning more and more about electronics, and poking around in a pioneer amp, I'm wondering several things. One of them is replacing capacitors or "recapping" as we all know it. In the schematics/manual one can find the values of caps as well as the type. There are ceramics...

Since the proposed substitute capacitor's 470uf > 311uf, is it likely that this substitution will work, or is it the case that I'm oversimplifying this and need to find something with closer specs printed on the side? capacitor substitution Share Cite asked Oct 26 rob 2 ...

160 Chapter 5 MOS Capacitor $n = N \exp[(E_c - E_F)/kT]$ would be a meaninglessly small number such as 10^{-60} cm⁻³. Therefore, the position of E_F in SiO₂ is immaterial. The applied voltage at the flat-band condition, called V_{fb} , the flat-band voltage, is the difference between the Fermi levels at the two terminals.

The space between capacitors may simply be a vacuum, and, in that case, a capacitor is then known as a "vacuum capacitor." However, the space is usually filled with an insulating material ...

Capacitance of a system of conductors depends only on the geometry of their arrangement and physical properties of the insulating material that fills the space between the conductors. The unit of capacitance is the farad, where $(\text{displaystyle } 1F=1C/1V)$. 8.3 ...

Capacitance is defined as the total charge stored in a capacitor divided by the voltage of the power supply it's connected to, and quantifies a capacitor's ability to store energy in the form of electric charge. Combining capacitors in series or ...

Types of capacitors: #1 Fixed Capacitor #2 Mica Capacitors #3 Ceramic Capacitors #4 Paper Capacitors #5 Plastic Capacitors #6 Electrolytic Where, In coulombs, Q represents the electric charge. The capacitance in farads is denoted as C . V is the voltage

$Q = CV$ Where C is the capacitance of the capacitor and it is the ratio of charge in one plate of the capacitor to the voltage applied between the plates. Unit of capacitance The unit of capacitance is farad (F). One farad can be defined as the measure of the capacitance of a capacitor that can store one coulomb of charge on its plates when a potential difference of one volt is applied ...

Overview. The electric potential is defined for the electric field. It is introduced as an integral of the electric field making the field the derivative of the potential. After discussing the ideas of electric ...

A capacitor for subs usefulness really comes into play during those quick and brief points in time where the sub draws a lot of power. If you have a good system and an alternator--in terms of vehicle use--that is a premium part, then no, ...

- Sub-threshold I_{ds} occurs o Current goes from drain to source while $V_{gs} \ll V_t$ - T_{ox} is scaled which can cause reliability problems o Can't handle large V_g without hot electron effects -Changes the V_t when carriers imbed themselves ...

Capacitance quantifies how much charge a capacitor can store per unit of voltage. The higher the capacitance, the more charge it can store at a given voltage. This is represented in the equation $\Delta V = \frac{Q}{C}$, which relates the voltage (ΔV) with the charge stored (Q) and the capacitance (C).
