Lead-Acid Battery; Nickel-Cadmium Battery; Lithium-Ion Battery; 1. Lead-Acid Battery. It is best known for one of the earliest rechargeable batteries and we can use it as an emergency power backup. It is popular due to its inexpensive facility. 2. Nickel-Cadmium Battery . It is also known as NiCad Battery.

It's clear that there's no "perfect" EV battery. But, technology has significantly improved since the old lead-acid days - and is still evolving. ? Nickel-metal hydride (NiMH) battery - older type, heavier, shorter lifespan, and has a more "significant environmental impact" than lithium-ion.

The 12-volt lead acid battery, for example, which has historically been used to power the starter of a combustion engine car, relies on an electrolyte containing lead ions and lead-based electrodes, whereas the lithium-ion battery relies on lithium ions, hence the name given to this technology.

Nickel-metal-hydride batteries are better at fulfilling a supporting role in hybrid cars rather than being the main power plant in electric vehicles. The only advantage of these...

Other things equal -- meaning size, cranking power and reserve capacity -- AGM costs roughly twice as much as flooded lead-acid. There's one more type of automotive battery worth mentioning here ...

Low energy density: Lead-acid batteries store significantly less energy per unit weight or volume compared to lithium-ion, limiting their driving range in EVs.

The first rechargeable battery used in automobiles was a lead-acid battery invented by French physicist Gaston Plante in the late 19 th century (Jose and Meikandasivam, 2017). In the following century, different types of batteries sprang up such as nickel-based (Ni-based) and lithium-based (Li-based) batteries.
