By incorporating graphene into the electrodes of Li-ion batteries, we can create myriad pathways for lithium ions to intercalate, increasing the battery's energy storage capacity. This means longer-lasting power for our smartphones, laptops, and electric vehicles, allowing us to stay connected and mobile for extended periods.

Based on cost and energy density considerations, lithium iron phosphate batteries, a subset of lithium-ion batteries, are still the preferred choice for grid-scale storage. More energy-dense chemistries for lithium-ion batteries, such as nickel cobalt aluminium (NCA) and nickel manganese cobalt (NMC), are popular for home energy storage and other ...
