General Design Rules 4 Reactors: Reactors are used in steps as detuned filters and are connected in series with capacitors. It must be designed to withstand fundamental and harmonic currents. Capacitors: Capacitors forms the core component in APFC equipment and plays a vital role in power factor correction.

Discharge the capacitor. Apply a known voltage to the capacitor through a resistor. Measure the time it takes for the voltage across the capacitor to reach a certain percentage of its final value. Compare the measured time constant with the expected value for a healthy capacitor. Method 6: Check the capacitor visually for faults
