Since capacitors have a leading power factor, and reactive power is not a constant power, designing a capacitor bank must consider different reactive power needs. For example, the configuration for a 5-stage capacitor bank with a 170 KVAR maximum reactive power rating could be 1:1:1:1:1, meaning 5\*34 KVAR or 1:2:2:4:8 with 1 as 10 KVAR.

Generally speaking, reactance can be divided into capacitive reactance and inductive reactance. If we classify these terms from a professional perspective, then the inductive reactor (inductor) and capacitive reactor (capacitor) are collectively referred to as reactors. The role of Reactors:
