So, for example, a typical AA Ni-MH rechargeable battery has a nominal cell voltage of 1.2V. If you find one with a capacity of 2,000mAh, it would have a 2.4Wh rating. If you want to take a Wh rating and convert it to mAh, divide it by the voltage of the battery ; and multiply that by 1000. For example: A 90Wh battery that has a voltage of 12V.

OverviewDesignHistoryFormatsUsesPerformanceLifespanSafetyGenerally, the negative electrode of a conventional lithium-ion cell is graphite made from carbon. The positive electrode is typically a metal oxide or phosphate. The electrolyte is a lithium salt in an organic solvent. The negative electrode (which is the anode when the cell is discharging) and the positive electrode (which is the cathode when discharging) are prevented from shorting by a separator. The el...

For RC Lingo, you are running a 2s battery (s=series, and there are two 3.7v cells ran in series inside an RC 2s battery). 18650 or L-ion type lithium batteries aren't often used because they do better with a steady draw, to where Lithium Polymer (Lipo pack) battery, can handle the rapid and sporadic high voltage draw associated with RC cars ...

**Capacity (mAh)** The capacity of a LiPo battery, measured in milliamp-hours (mAh), indicates the total charge it can hold. A higher mAh rating means the battery can provide more current over a longer period. For instance, a 5000mAh battery can theoretically provide 5000mA of current for one hour. **Discharge Rate (C Rating)**

**Example:** A typical NiMH AA battery might be rated around 2000-2500 mAh. **Lead-Acid Batteries:** Used in larger applications like vehicles and backup systems, lead-acid batteries are rated in amp-hours (Ah), where 1 Ah equals 1000 mAh. **Example:** A lead-acid battery rated at 100 Ah would equate to 100,000 mAh. **Factors Influencing Battery Performance**
